

SOFTWARE + HARDWARE

Product-specific development

Product development for various process variables

We develop and plan metrological solutions together with our partner companies. This allows applications of sensors, from housings to customer-specific electronics and software, to be solved. The sensors and measuring systems with digital or analog interfaces are easily integrated into your facility or process. Our extensive expertise in the development of electronics ranges from the formulation of concepts to the realisation of complete solutions.

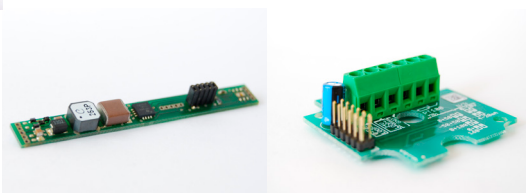

Software development:

LabVIEW Basis is used for development alongside many other development platforms. The LabVIEW software is suitable for numerous applications in measuring, control and regulation technology. This allows facilities and processes to be easily controlled.

Hardware development:

We integrate all necessary sensors and actuators into your system. We will gladly develop a new solution for your product together with you. Please feel free to get in contact with us.

Solutions/applications: Operating theatres, clinical laboratories, building automation, low-power electronics in battery-operated devices, embedded Linux systems, radio systems, flow measurements for fluid media, and much more.

We find first-class solutions. Challenge us.
